Summary

Experienced software engineer with a strong background in backend systems development. Proficient in C++ and Python, with experience building, testing, and maintaining scalable, efficient, and high-performance systems. Eager to grow professionally and contribute to the ongoing success of the organization.

Technical Skills

C, C++, Python, SQL, Git, Unix/Linux, SSH, CMake, Docker, gdb, gprof, ASan-TSan, multithreading, vim, tmux, AWS

Professional Experience

Software Engineer (August 2024 – June 2026), *Amdocs Philippines Inc.*

- Built high-performance, scalable C++ software and automation solutions for complex workflow and data-processing requirements across Oracle/PostgreSQL databases, APIs, and Linux systems hosted on Azure.
- Utilized Python, Java, Bash, KornShell, Groovy, and SQL for system integration and automation.
- Performed root cause analyses of software issues and codebases, and implemented efficient solutions.
- Collaborated within Scrum development teams to implement and deliver software features while tracking development tasks using Jira and Confluence.
- Implemented and optimized system features while adhering to best practices and standards within the organization.

Educational Attainment

Bachelor of Science in Computer Engineering, *Technological Institute of the Philippines - Quezon City*

Portfolio Projects

Peer-to-Peer File Sharing Network System

- Developing a peer-to-peer file sharing system in C++ for distributed network communication.
- Built the core networking layer with dual-stack IPv4/IPv6 support and event-driven I/O.
- Applying modern C++ techniques, including RAII, smart pointers, mutexes, lock-based synchronization, multithreading, and design patterns to improve performance, resource efficiency, and maintainability.
- Currently implementing peer discovery and file transfer capabilities.

Adaptive Time-Window Chunking with Threshold-Bound Querying

- Developed a Python-based automation tool to efficiently retrieve large datasets from the company's Elasticsearch API while adhering to the 10,000-record query limit.
- Implemented a binary-search-style algorithm with dynamic sliding time windows to automatically calculate optimal date and time ranges for data extraction, eliminating manual adjustments and improving retrieval efficiency by 98%.

Professional Development

Beginning C++ Programming - From Beginner to Beyond, Udemy

Master the Coding Interview: Data Structures + Algorithms, Udemy

CPA: Programming Essentials in C++, Cisco Network Academy
